

APPROPRIATE TECHNOLOGY

Access to the resources essential for dignified life is, throughout the World, unfair and unequal.

Alternative solutions to address this imbalance can be found through the use of appropriate technologies to find economically and environmentally sustainable alternatives.

Among the most essential areas to be addressed are:

Drinking water and sanitation

Health

Hygiene and women's empowerment

Fuel-efficient cooking stoves

Construction

Electrical supply

Environmental education

All systems must be:

Easy to construct and maintain

Low cost

Using local resources

Sustainable in the long-term.

The autonomous, decentralised and organised community is in the final instance the decisive nucleus of its own future.
